Video demo

1. The problem we solve. First-round technical screening is a bottleneck. Every Data Scientist and AI Engineer applicant needs a live 30–60 minute call with a senior engineer just to gauge basic depth — repetitive for interviewers, slow for candidates, and inconsistent from one interviewer to the next. Scheduling alone stalls hiring pipelines for days, and strong people drop out while they wait.

2. Who it's for. Hiring teams at AI/data organizations — technical recruiters and engineering managers running high-volume first-round screening — and the Data Scientist / AI Engineer candidates who want a fast, fair shot without waiting on calendars.

3. How the agent solves it. It runs the entire first round autonomously — voice or text, English or Vietnamese: greets the candidate, walks their background (introduce yourself → a project → experience), then probes technical topics with adaptive multi-layer follow-ups and hands-on chart exercises (boxplots, model metrics, confusion matrices), scoring every answer against five consistent pillars.

4. The value it delivers. Teams screen unlimited candidates 24/7 with zero interviewer time; every candidate gets the same fair, structured evaluation; and hiring managers receive an evidence-backed report in minutes instead of days — turning a multi-day scheduling bottleneck into an instant, on-demand step.
